

# Business Intelligence Reporting with Pro-Cloud

Are you currently using old fashioned reporting methods to collect business data and looking for an asset management system that can provide comprehensive in-depth analysis of your inventory management operation?

## Reporting

Using the correct reporting tools can transform a business and provide real-time information required to improve efficiencies and increase the profitability of an organisation.

Reporting on business operations will;

- Address specific issues
- Assist in making key business decisions
- Bring clarity to areas of a business
- Provide insight into business performance
- Streamline inventory management procedures
- Enable easy data comparisons

Microsoft Business Intelligence Reporting (BI) is the answer to all your analytical requirements. BI reporting gathers data and extracts relevant insights.

The proven reporting suite has become fundamental for many organisations, enabling a clear understanding of business operations and inventory management.

## Microsoft Business Intelligence

When utilising BI reports a more in-depth analysis of data is provided, details of business areas are realised, and comparisons are made with confidence.

There are so many benefits of using BI Reports, and if used correctly the information obtained can be invaluable to a business.

Here at CSS, we utilise BI reports throughout our software solutions. BI reporting can be used across all our platforms, specifically our inventory management system Pro-Cloud, which allows both in-built and bespoke reports to be generated at any time.

Customising reports allows an organisation to drill down and analyse every part of their operation, with a variety of data sets to choose from.

Having access to reporting options also enables full evaluation of individual and team performance. Reports can compare KPI's and provides the tools to feed back to personnel and boost everyday performance.
